

Solution to Problem 79

The solution requires finding “primitive Pythagorean triples,” with restrictions. Any primitive Pythagorean triple can be found using $p^2 - q^2$, $2p q$, $p^2 + q^2$ where $p > q$ and p and q are any two numbers.

The rules are, in addition to being integers:

- (a) $p^2 + q^2 \leq 100$, so $p \leq 9$, otherwise $q = 0$. ($p^2 + q^2$ must generate a number that is an integer on a 100 foot tape, hence less than or equal to 100)
- (b) $2pq \leq 100$ (the product of twice $p q$ must also generate an integral number on a 100 foot tape)
- (c) $2pq > 0$, so $p q > 0$ and $p = 2, q = 1$ is the lowest combination (which gives the well known $2^2 - 1^2 = 3$, $2 \times 2 \times 1 = 4$, $2^2 + 1^2 = 5$ triple)

also

- (d) if p and q are relatively prime, only primitives result
- (e) if not both are odd, primitives result.

Let $q = 1$ while p changes from 2 to 9 [Rule (a)], then let $q = 2$ while p changes from 3 to 9, and so on until $q = 8$ and $p = 9$ [which is eliminated by Rule (a)]. There are $8+7+6+5+4+3+2+1$ combinations of p and q with these rules.

Numbers like 30:40:50 and 30:72:78 are multiples of 3:4:5 and 5:12:13, respectively, and are not unique. There are actually 104 combinations, but they include 3:4:5, 3:5:4, 4:3:5, 4:5:3, 5:3:4, 5:4:3 and multiples and rearrangements of the other unique combinations. The following 16 combinations are unique:

q	p	skipped by Rule	$p^2 - q^2$	$2 p q$	$p^2 + q^2$
1	2	3	4	5
1	3	(e)			
1	4	15	8	17
